

Breast Enlargement by means of autologous fat transplantation

Breast augmentation using autologous fat transplantation often occurs in multiple surgical sessions. The fat is extracted from the body from various regions, specially processed and reintroduced around the breast. With this method, a moderate enlargement of the breast is possible, without using foreign material.

The fat is removed from various regions in the body using the technique of liposuction. This also offers the benefit of enhancing the silhouette and shape of the body.

QUESTIONS YOU MAY CONSIDER ASKING AT THE CONSULTATION:

Is the fat visible?

What is the duration of the procedure?

How long does the fat that has been transferred to
the breast last?

How long do I need to wear the post-operative
bra?

What happens if I put on or lose weight after the
procedure?

INFORMATION ABOUT THE PROCEDURE:

Duration of case: 1.5 hours

General Anaesthesia required

Post-operative recovery approximately
4-7 days

No physical activity/sport for approximately
2 weeks
